

Crud Step in Laravel

step 1:

first we have to run following command

1)make controller

```
php artisan make:controller StudentController -r -m
```

2)make a model

```
php artisan make:model Student -r -m -c
```

step2:

after the controller created we start a xampp apache and my sql then we go on our project and find .env and check database name,password,username

Step 3:

after the step 2 we create a folder in resources->views->foldername and create one file after that we call that file in controller create method.

```
public function create()
{
    return view('student.add');
}
```

step4:

than we write a form in our file that we add on student folder

```
<!DOCTYPE html>

<html lang="en">

<head>

    <meta charset="UTF-8">

    <meta name="viewport" content="width=device-width, initial-scale=1.0">

    <title>Register</title>

    <link href="https://cdn.jsdelivr.net/npm/bootstrap@5.3.3/dist/css/bootstrap.min.css"
rel="stylesheet" integrity="sha384-
```

QWTKZyjpPEjISv5WaRU9OFeRpok6YctnYmDr5pNlyT2bRjXh0JMhjY6hW+ALEwIH"
crossorigin="anonymous">

<script src="https://cdn.jsdelivr.net/npm/bootstrap@5.3.3/dist/js/bootstrap.bundle.min.js"
integrity="sha384-
YvpcrYf0tY3lHB60NNkmXc5s9fDVZLESaAA55NDzOxhy9GkcIdslK1eN7N6jleHz"
crossorigin="anonymous"></script>

</head>

<body>

<form action="" method="">

<div class="mb-3">

<label for="name" class="form-label">Name</label>

<input type="text" class="form-control" id="" aria-describedby="emailHelp" name="name">

</div>

<div class="mb-3">

<label for="exampleInputPassword1" class="form-label">Password</label>

<input type="password" class="form-control" id="exampleInputPassword1"
name="password">

</div>

<div class="mb-3">

<label for="exampleInputPassword1" class="form-label">Roll NO</label>

<input type="tel" class="form-control" id="" name="rollno">

</div>

<div class="mb-3">

<label for="exampleInputPassword1" class="form-label">Email</label>

<input type="email" class="form-control" id="" name="email">

</div>

<div class="mb-3">

<label for="exampleInputPassword1" class="form-label">Coures</label>

<input type="text" class="form-control" id="" name="coures">

```
</div>
```

```
<button type="submit" class="btn btn-primary">Submit</button>
```

```
</form>
```

```
</body>
```

```
</html>
```

Step 5:

after that form create a database name is Laravel and create a table whose name is student and other side go on the migration->your model and write all your database filed in such a following way

```
public function up()
{
    Schema::create('students', function (Blueprint $table) {
        $table->id();
        $table->string('name'); //database datatype is varchar
        $table->string('password'); //database datatype is varchar
        $table->integer('rollno'); //databse datatype is int
        $table->string('email'); //database datatype is varchar
        $table->string('coures'); //database datatype is varchar
        $table->timestamps();
    });
}
```

step 6:

now add csrf in form

```
<form action="" method="post">
```

```
@csrf
```

```
<div class="mb-3">
```

```
<label for="name" class="form-label">Name</label>
```

```
<input type="text" class="form-control" id="" aria-describedby="emailHelp" name="name">
```

</div>

than apply post method in route and give route name

```
Route::get('/student',[StudentController::class,'create']);
```

```
Route::post('/student/store', [StudentController::class, 'store'])->name('student.store');
```

step 7:

now in action parameter you have to write following text

```
<form action="{{route('student.store')}}" method="post">
```

step 8:

now in controller you have to write in store method

```
public function store(Request $request)
{
    return $request->all();
}
```

step 9:

write use DB to use a database in controller

```
public function store(Request $request)
{
    DB::table('students')->insert([
        'name' => $request->name,
        'password' => $request->password,
        'rollno' => $request->rollno,
        'email' => $request->email,
        'coures' => $request->coures
    ]);
}
```

```

    });

    // return $request->all();

    return "success";
}

```

**** Select ****

Step10:

first create the file of view and create a table

step 11:

after create a table open controller and write following to get a all records from a table

```

public function index()
{
    //
    $students = DB::table("students")->get();
    return view('student.view',compact('students'));
}

```

index method are used to display all record just like select

step 12:

after making this we have to change a form with database info

```

</thead>

<tbody>

<?php
foreach($students as $student)
{
    ?>

<tr>

<td><?php echo $student->id; ?></td>

<td><?php echo $student->name; ?></td>

```

```

<td><?php echo $student->password; ?></td>

<td><?php echo $student->rollno; ?></td>

<td><?php echo $student->email; ?></td>

<td><?php echo $student->coures; ?></td>

</tr>

<?php } ?>

</tbody>

```

step 13:

after that make a small changes in route and controller

```

Route::get('/',[StudentController::class,'index']->name('student.list');

return redirect()->route('student.list');

```

update or delete

we have to add following route

```

Route::get('/student/{id}/edit',[StudentController::class,'edit']->name('student.edit');

Route::put('/student/{id}/update',[StudentController::class,'update']->name('student.update');

Route::get('/student/{id}/destroy', [StudentController::class, 'destroy'])-
>name('student.destroy');

```

following link in list page

```

<a href="{{route('student.edit',$student->id)}}" class="btn btn-primary">Edit</a>

<a href="{{route('student.destroy',$student->id)}}" class="btn btn-danger" >Delete</a>

```

step14:

first we create a edit.balde.php page then we put our insert form in edit page

after that in controller edit function we write a following code

```

public function edit(string $id)

{

    return view('student.edit',compact($id));

}

```

after that we add

```
$student = DB::table("students")->where('id',$id)->first();
```

in edit method

```
public function edit(string $id)
{
    //
    $student = DB::table("students")->where('id',$id)->first();
    return view('student.edit',compact('student'));
}
```

Step 15:

after that in edit page in form we give a value to field

```
<label for="name" class="form-label">Name</label>
```

```
<input type="text" class="form-control" id="" name="name" value="{{ $student->name of the
form field }}">
```

after that in form of edit page we have to do following code

```
<form action="{{ route('student.update',$student->id) }}" method="post">
@method('put')
```

after write the following code in update method of controller

```
public function update(Request $request, string $id)
{
    Db::table('students')->where('id', $id)->update([
        'name'=>$request->name,
        'address'=>$request->address,
        'enr'=>$request->enr,
        'aadhar'=>$request->aadhar,
        'dob'=>$request->dob,
        'blood'=>$request->blood,
        'mobile'=>$request->mobile
    ]);
    return redirect()->route('student.list')->with('success', 'Student updated successfully.');
```

step 16:

to delete the record we have change only in controller

```
public function destroy($id)
{
    $flag = Db::table('students')->where('id', $id)->delete();
    if($flag)
    {
        return redirect()->route('student.list')->with('success', 'Student delete successfully.');
```
